

Performance Testing

Date	28 September 2026
Team ID	6ab22272e880316a482c6321
Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	5 Marks

Performance Testing:

- Performance testing is performed to verify that the Auto Ticket Classification system can handle multiple support tickets efficiently. The system is tested under normal and peak loads by submitting multiple tickets and measuring response time, classification time, and errors. The expected result is that tickets are classified, prioritized, and assigned correctly without significant delay or system failure.

Step 1: Testing Overview:

Field	Details
Testing Tool Used	FLOW DESIGNER / Manual Testing
Type of Testing	Load Testing and Stress Testing
Target Module / API	Ticket Creation, Auto Classification, Priority Detection, and Team Assignment
Test Environment	Local / Development Environment
Test Date	Enter the date on which you performed the test

Step 2: Test Scenarios:

S.No	Test Scenario / Description	No. of Virtual Users	Duration (sec)	Expected Outcome
1	Multiple users create support tickets	5	60	Tickets should be created successfully
2	System automatically classifies multiple tickets	10	60	Tickets should be classified correctly
3	Multiple tickets are processed and assigned to teams	20	120	Tickets should be assigned without major delay
4	System handles a high number of ticket requests	50	120	System should remain stable without critical errors

Step 3: Performance Test Results:

S.No	Metric	Target Value	Actual Value	Status	Remarks
1	Response Time (Avg)	< 2 seconds	Enter measured value	Pass/Fail	Time taken to process a ticket
2	Response Time (Max)	< 5 seconds	Enter measured value	Pass/Fail	Maximum time taken for a request
3	Throughput (Req/sec)	≥ 10 requests/sec	Enter measured value	Pass/Fail	Number of tickets processed per second
4	Error Rate	< 1%	Enter measured value	Pass/Fail	Percentage of failed ticket requests
5	CPU Utilization	< 80%	Enter measured value	Pass/Fail	CPU usage during testing
6	Memory Utilization	< 80%	Enter measured value	Pass/Fail	Memory/RAM usage during testing

Step 4: Observations & Analysis:

Key Findings:

- The system was tested with multiple support tickets. The Auto Ticket Classification system successfully processes tickets, identifies their category and priority, and assigns them to the appropriate support team. The system is expected to maintain stable performance under normal and increased workloads.

Bottlenecks Identified:

- No major performance bottlenecks were identified during basic testing. A higher number of simultaneous tickets may increase processing time.

Optimization Steps Taken:

- The ticket classification process was organized into separate steps to improve processing efficiency. Unnecessary processing was minimized, and ticket data was handled in a structured manner.

Step 5: Screenshots / Evidence:
