

Project Executable Files

Date	28 September 2026
Team ID	6ab22272e880316a482c6321
Project Name	Implement Client Script & UI Policy (Incident)
Maximum Marks	3 Marks

Project Executable Files

This section outlines the deployable assets, XML schema exports, and configuration files required to deploy the automated ticket classification solution within a ServiceNow instance.

This section documents the structured compilation of executable files, schema configurations, and deployment packages required to implement the "Auto Ticket Classification using Flow Designer" project within a ServiceNow environment. Unlike traditional programming tracks that depend on compiled binaries or local execution runtimes (such as .exe, .jar, or app.py), cloud-native no-code/low-code platforms rely on XML-based Update Sets, application scope packages, and modular workflow schema exports. All project implementation assets have been systematically organized to ensure seamless portability, reproducibility, and deployment across target ServiceNow instances.

Step 1: Submission Checklist

S.No	Item to Submit	Submitted (Yes / No / NA)
1.	Complete source code (all files and folders)	YES (<i>ServiceNow Update Set XML / Flow Schema exports</i>)
2.	README / Setup Guide (instructions to run the project)	YES
3.	requirements.txt / package.json / dependency file	NA (<i>No-Code Platform; utilizes ServiceNow base instance dependencies</i>)
4.	Database schema / seed files (if applicable)	YES (<i>Custom table dictionary u_incident_workflow & choice lists</i>)
5.	Environment configuration file (.env.example or similar)	NA (<i>Configured via ServiceNow Instance Properties / Update Sets</i>)
6.	Deployed application URL (if hosted)	YES (<i>ServiceNow Developer Instance URL</i>)
7.	APK / Executable binary (if applicable for mobile/desktop apps)	NA
8.	Dockerfile / Containerization config (if applicable)	NA (<i>Hosted on cloud-native ServiceNow platform architecture</i>)
9.	Test files and test results	YES (<i>UAT Test Cases & System Email Execution Logs</i>)

Step 2: File / Folder Structure

Step 3: Deployment / Access Details

Field	Details
Hosted / Deployed URL	https://dev319286.service-now.com/now/nav/ui/classic/params/target/u_incident_workflows.do%3Fsys_id%3Ddad562125c3ef0f1046a0e04
Login Credentials (Demo)	Username: padhmini.p2007@gmail.com Password: Veni@107
Platform / Hosting Provider	ServiceNow Cloud Platform (PaaS)
Repository Link	https://github.com/padhminip2007-cmd/AUTO-TICKET-CLASSIFICATION-USING-WORKFLOW1
Demo Video Link	https://drive.google.com/file/d/121Ay7qLyBBwVFD9tPkqX92I1ZwWOXM3W/view?usp=drivesdk

Step 4: Run Instructions

Step No.	Process Name	Action to be Performed by Evaluator	Expected Outcome / Verification
1	Instance Login	Open the browser and visit the hosted ServiceNow developer URL: https://dev319286.service-now.com(https://dev319286.service-now.com). Enter administrator credentials.	Successful authentication and loading of the ServiceNow Dashboard.
2	Form Navigation	Navigate to the incident workspace or table URL (u_incident_workflows.do) via the navigator filter.	The custom IT Helpdesk incident form opens up cleanly.
3	Data Input	Fill out the test record: Select Caller (<i>Abe/ Tuter</i>) and enter text under Short Description (e.g., Wi-Fi not working in library). Keep Category/Subcategory as -- None --.	Test ticket data is populated accurately prior to submission.
4	Execution & Check	Click Submit / Update and re-open the ticket record.	Flow Designer automatically parses keywords, updates the Category/Subcategory, and triggers notification emails.

Step 5: Known Issues / Limitations

S.No	Known Issue / Limitation	Workaround / Status
1.	Strict Keyword Dependency: The Flow Designer logic relies on predefined keyword strings (e.g., "Wi-Fi", "Projector") in the short description; unexpected slang, abbreviations, or spelling mistakes can occasionally bypass automated routing.	Workaround: Implemented standard fallback catch-all routing to a general IT queue, with future plans to integrate AI/NLP-based intent matching.
2.	Developer Instance Hibernation: ServiceNow Free Developer Instances (dev319286.service-now.com) automatically hibernate after periods of inactivity, causing temporary access delays.	Workaround: Instance is manually re-awakened prior to evaluations; configured as an inherent cloud platform constraint rather than a code defect.
3.	Concurrent Execution Queue Limits: Simultaneous multi-user ticket submissions under heavy load can experience minor queue delays in asynchronous background Flow Designer triggers.	Workaround: Execution logs are monitored via system event tables; optimized trigger conditions to minimize processing overhead.
